ANAI AH HEALTHCARE NET ZERO COMMITMENT BY 2050

1. Our Commitment

Anaiah Healthcare is committed to supporting the transition to a net zero economy and recognises the importance of reducing greenhouse gas emissions associated with our business operations, manufacturing activities and supply chain.

We commit to working towards net zero greenhouse gas emissions by 2050, or earlier where reasonably practicable, through a progressive approach to measuring, managing and reducing our environmental impact. As a UK manufacturer of powdered and liquid oral nutritional supplements, we recognise that our environmental footprint extends beyond our own manufacturing site to include the sourcing of raw materials, ingredient processing, packaging, energy consumption and product distribution.

2. Our Approach to Emissions Reduction

Anaiah Healthcare will pursue practical, proportionate measures to reduce emissions across our operations and supply chain, taking account of our size, resources and manufacturing requirements.

Our approach includes:

- **Energy efficiency:** Identifying opportunities to reduce energy consumption at our UK manufacturing site through efficient equipment, operational improvements and responsible energy management.
- **Responsible sourcing:** Seeking to source ingredients and materials locally or within the UK where suitable and commercially practicable, while maintaining product quality, safety, nutritional requirements and security of supply.
- **Supply-chain engagement:** Working with key suppliers to improve understanding of the environmental impacts associated with raw materials, ingredients and packaging, and encouraging more sustainable practices where feasible.
- **Packaging:** Exploring opportunities to reduce packaging waste, improve material efficiency and use recyclable or lower-impact packaging where technically suitable and consistent with product safety and shelf-life requirements.
- **Transport and distribution:** Considering transport efficiency, delivery planning and opportunities to reduce unnecessary movements and associated emissions.
- **Waste reduction:** Seeking to minimise manufacturing waste and improve the efficient use of raw materials and resources.
- **Continuous improvement:** Reviewing opportunities to improve environmental performance as technologies, supplier information and good practice develop.

3. Measurement, Monitoring and Progress

We recognise that achieving net zero requires an understanding of our greenhouse gas emissions and the identification of meaningful reduction opportunities.

Anaiah Healthcare will seek to improve its understanding of emissions associated with its operations and supply chain, using appropriate information and measurement methods as these become available. This may include emissions associated with purchased energy, manufacturing activities, raw materials, packaging and distribution.

As our measurement capabilities develop, we will use the information available to identify priorities, assess practical reduction measures and review progress towards our 2050 commitment.

We recognise that supply-chain emissions are an important part of the overall environmental impact of manufactured nutritional products and will seek to improve visibility of these emissions through engagement with relevant suppliers.

4. Governance and Review

Responsibility for overseeing this commitment rests with Ryan Rodrigues, Director.

Anaiah Healthcare will review this commitment periodically and at least annually, considering developments in our business, available emissions information, opportunities for improvement and applicable customer or regulatory requirements.

We will seek to strengthen our environmental practices progressively and communicate relevant information about our approach and progress when reasonably requested by customers or contracting authorities.

5. Our Long-Term Commitment

Anaiah Healthcare recognises that reaching net zero requires sustained action, collaboration and continuous improvement across the value chain. We are committed to taking practical steps to reduce our environmental impact while continuing to manufacture safe, high-quality medical nutritional products and maintaining reliable supply to our customers.

Our objective is to work progressively towards **net zero greenhouse gas emissions by 2050**, supporting a more sustainable future for our business, our customers and the communities we serve.
